Simon Dugast

Design of Dynamic Web Systems
IMRAD report

Introduction

I chose this course, and therefore this project, because I was really interested in the subject. Unfortunately, the absence of a course (which I had not paid attention to when I chose this course I admit) in parallel with the project was detrimental to me because I did not have the skills to do it.

In spite of this, I wanted to continue because the project was very complete and interesting. So, I followed online courses on a free access platform. As a result, I used a large part of the time that I had been given to follow these courses and therefore did not advance the project.

A few weeks before the end, we were almost at the starting point and my partner then stopped the project, so I found myself alone in front of a project that I didn't have the capacity to do.
I still tried to propose something because I didn't want to give anything back.

The work I am giving back today is therefore, I am aware, far from the expectations of this course. However, I have really given my best over the last few weeks, given the conditions and my skills. I hope you will take this into account.

API:

The API is not complete, I really had problems to understand the concept and the architecture of it.

It is linked to my database, so it is possible to get data about prosumers and print it into the console, but I didn't manage to completely implement it and make it work with the frontend.

Time log:

In this table are summarised only the hours I spent working on this course.

Tasks	Hours
Online lessons	100
Understanding of the project	40
Development work	60
TOTAL	200

Protocol:

Everything that is needed to make my website work is detailed in the README.md file, available on my GitHub repository.
